

Winter 2017/18

Oct 3, 2017

All in all, it looks like winter 17/18 could be very similar to our previous winter. Many forecasts are calling for “about normal” across the country’s upper mid-section with above normal temperatures in the south and east. As you may recall, two winters ago it was much warmer than normal and last winter was closer to normal, but still warmer than normal. While we may finally see “normal” temperatures and precipitation this winter in the upper mid-section, it will certainly feel a bit harsher given the past two winters.

Latest NOAA Outlooks for Temperature and Precipitation for Dec17, Jan18 and Feb18

This fall appears to be starting out mild with very little below normal temperatures forecasted for October.
